

Mysterious Growing Disappearing BEE COLONY Collapse CRISIS
By Micheal Sunanda

There's an international & now Oregon crisis with millions of missing honey- bees gone from 1000s of beehives in US, Poland & Spain, just came to Oregon. I use the Perma-culture 'design science patterns' approach to this alarming problem. Reports been coming from news sources for 2 months & just told of the same 'bee crisis' in Oregon, where beekeepers are finding many hives empty.

To make it worse they haven't found the missing-bees to analyze them to learn what's causing them to leave their nests & die they assume. The spreading of disappearing bees are strange in the extreme. That's causing many beekeepers bankruptcy & needing to rebuild their hives. They were trucking hives to distant farms to pollinate fruits for harvesting later. So missing bees won't be pollinating fruits this year, won't be harvested & sold in US\$ markets? Too bad for our tasty summer fruit treats! What about organic growers needing bees pollinating & the honey harvests?

Why are bees fleeing their nests? Many causes are speculated on now by agriculture experts, & beekeepers who've been spraying toxic pesticides into bee hives for years to kill mites. It seems that multiple causes are present because of 25 or so states reporting empty bee-hives having different conditions inside & around their nests. Also missing bees are needed to dissect & learn what's killing them? But maybe the poisoned hives can tell us why?

The growing 'bee crisis' has multiple causes (like natural fertility) has many chemicals that combine multiplying their effects, is called "synergy or disynergy". Also the deadly poison 'Round up' was sprayed for years on GMO plants being immune to the herbicide that bees contact for honey & pollen. Farming poisons accumulate in soils & waters getting into local bees. Many beekeepers feed bees corn (sugar) syrup, & they think maybe some was 'bad' or toxic killing the bees or driving them to search for better food?

We may assume the bees were hibernating during winter & fled 'toxic' hives to survive or die, who knows where?! Bees are very sensitive creatures & won't return to deadly hives? Some concerned bee people guessed that bees lost their critical navigation sensitivity & skill for returning to nest & died lost in bush or from exposure searching for hives during the crazy winter & spring weather? How will beekeepers restore their gone bees or toxic hives? How will this effect the future of farming depending on bee pollination & eminent crash of fruit harvests? Even if they find the causes, how will they solve or prevent it from recurring?

I believe the general cause is deadly accumulating "TTL" of 'acidosis' inside the hives, from the pesticides & herbicides sprayed in hives & on (GMO food) crops they pollinate all drove them away from deadly bees nest to die or rebirth in Nature? A 'wild theory' of a deadly mutated microbe is driving those missing bees away, confused, & searching for a new home site or to die.

Could strange cosmic, natural or man-made vibrating frequencies be stressing the bees to flee or get lost while flying out to pollinate flowers? Or are the bees drinking poisoned waters sickening them? But so many variables, its very confusing & mysterious!
